SEDIMENT ISOPACHS

BY R. HOUTZ, M. EWING, D. HAYES, AND B. NAINI

Sediment isopach. Values are in tenths of seconds of reflection time. A reflection time of one tenth of a second represents sediments approximately 100 m thick. (See text for further discussion.)

Ship track along which seismic data were obtained. Continuous profiles were recorded along approximately 95% of all the tracks shown.

Areas where reflection time was less than one-tenth of a second.
